TGD-Pro

TGD-Pro enhances QuickTac to work with continuous line images. With it, you can import graphics, JPEG, BMP, GIF or WMF or create your own using the drawing tools included. Graphics can then be modified with color and backgrounds removed.

The most common use of these graphics is to make line diagrams that are used to create swelled paper graphics

Any file created can be sent directly to a printer or converted to a Braille graphic and embossed. Graphics that are intended for printing can utilize various line styles and or use different fills.

Mathematical plots generated in Scientific Notebook can be imported into TGD-Pro, edited converted to braille and then imported into DBT 11.1. Just go to the Layout, Picture, Add Menu Choice to insert your new graphic into DBT 11.1.
